I'd like to write a small C++ class to hold a data member with a known value and use it in a situation where it's either null or has a valid value that I'd like to use. I don't have an issue with having a protected data member with a "setter" method. I'm not sure how I'd implement the getter, but whatever is appropriate would be fine. But I'm wondering if there's something "proper" or C++ convention that gives me access to the container object via a public method of the same name. It seems a little cleaner to have a public method to get/set the data member than to have the setter. I don't have much experience with this kind of thing. A: I'd like to write a small C++ class to hold a data member with a known value and use it in a situation where it's either null or has a valid value that I'd like to use. Your problem is not really "data members with a known value". Instead, what you want to do is to have an object with a known (static) value. Then, that value should be handled by the constructor of the class. 

```
public class foo { private: static const int bar = 1; int data; public: foo(int value) : data(value) { } }
```

 (Of course, you can also have the static constant as a member variable, but it's slightly more intrusive for the class

The software is open source, so you can download and install it on your computer directly from MSDN. Today, I will show you how to get fingerprint logon authentication to work on Windows XP and Windows Vista. The default database of fingerprints is stored at C:\Documents and Settings\All Users\Documents\Microsoft\Fingerprint. With the new fingerprint database, you can use the following operation to start Microsoft Authenticator: Put device in the proper position.

I recently started playing Magic the Gathering. There are cards that are released without a box. If you do not want to buy the box, are these cards playable or will you just be carrying around a box of cards? A: You only need the card in the same pack as the box, but you don't actually need the box at all. I've played with cards that were released without a box over the past several years and have never had a problem since the pack had the box. I generally hold onto the box for a while in case I want to trade with a friend, but I never touch the box itself after I open a pack. If you purchase a deck from a card shop, they will often include the box with the deck. A: No From official MTG blog: Unboxed: An unboxed card is a card that has no boxes, sleeves, and inserts. Unboxed cards are called "opening a pack" or "opening a booster pack." (There are, however, a few exceptions to this rule. Some kinds of promotional cards have box-tops that need to be opened, such as cards from a product set, from one of the Magic: The Gathering duel decks, or promotional cards from a tournament.) The name "unboxed" really does refer to what happens when you open a pack, though. Other than that, there's little special about an unboxed card. You can use it the same way you'd use a regular card. A: After opening a pack, I have played with (and sold) unboxed cards without a box. There are two things to watch out for though: You'll need to make sure the back of the card is not thickened. The thickened back is a reference to the product set, and shows that the card is from a pack of cards. It's a bit more expensive, and the cards often have a sticker on them saying "From a product set." It's useful
